Introducing Poppy.TM For Personal Computer customers who need a Personal Business System.

The decision to buy a personal computer is a most important decision for customers. Selling the right computer means making a satisfied customer for you.

It means selling a computer with power to handle the many applications within an office. A computer with unlimited storage capabilities. And a computer that gives a customer a growth path to handle his expanding computing needs.

In areas where the Personal Computer comes up short, the new PoppyTM excels.

Take power. Poppy is a 16 bit microprocessor with multiprocessor architecture for business performance beyond most other microcomputers. System software is MS-DOS,

CP/M-86, MP/M-86, and Xenix.

Storage. Poppy allows up to 1,152K memory with hard disk storage to 60MB.

Expandability. Multi-user, multi-tasking up to 12 workstations.

Poppy's detachable keyboard is user friendly. A 14" monitor has high resolution with a tilt and swivel base for operator comfort. A full complement of specialized applications software in medical/dental, insurance, and retail is available, as well as business packages for complete accounting, word processing, financial planning and modeling. All of the many applications in StarBasic for Durango's current 8 bit systems run on the 16 bit Poppy systems.

Poppy is new, dynamic, and

here now for the customer to benefit from and for you to profit from. One demonstration will show you why the Personal Business System is what your customers should be looking to buy over The Personal Computer.

For information on how you can benefit from a business system that has what it takes to satisfy customers, call (800) 327-6779. Or write Durango Systems Inc., 3003 No. First Street, San Jose, California 95052.
